SPIN-OFF D · CONCEPT

Local-First Consulting

Consulting and delivery for local-first and peer-to-peer software

We do not sell the idea that it works. We show the systems where it does.

Source

Why now

The demand does not come from enthusiasm for technology but from four very concrete pressures.

- **Privacy is no longer an opinion**

Practices, law firms, schools and public bodies have to justify why personal data sits with a US provider. "It stays on the device" is the shortest justification there is.

- **The cloud bill grows faster than the product**

Every user costs monthly, every location costs monthly. Software that runs between devices does not have that curve.

- **Offline is normal, not exceptional**

Building sites, field service, hospital basements, country roads, ships, trade-fair halls. Applications that stall there cost working time — every day.

- **The people are missing**

CRDTs, libp2p, NAT traversal, WebAuthn, IPFS: each is known, the combination is rare. That combination is our daily work.

What we offer

Three stages that build on each other. Each can be booked on its own — nobody has to start with the big project.

1 · Orientation

- Architecture workshop, one to two days
- Feasibility: does local-first fit this case — and where does it not?
- A written result stating the limits, not just the promises
- Fixed price

2 · Delivery

- A prototype in weeks, not quarters
- Built from existing blocks instead of from scratch
- Integration with what already runs
- Project or day rate

3 · Operations & team

- Relays, pinning and archive from spin-off A
- Training so the team can continue without us
- Code reviews and standby
- Retainer

Stage one is deliberately small and cheap. Whoever says "no" after the workshop still got something — and we sold nothing that did not fit.

Why us

Local-first consulting barely exists because barely anybody has built the systems. In the meeting we show what runs.

- **The whole stack, open to inspect** TODAY

Identity, data, sync, infrastructure, archive — every layer an open-source block, several of them published as npm packages.

- **A complete application as proof** TODAY

Yoga Suci (spin-off C): till, passes, check-in across locations, without a server — with end-to-end tests across real device contexts.

- **Contributions where the standard is made** TODAY

Our fork of the official libp2p showcase runs publicly; the WebRTC-over-QR transport is published as its own package.

- **We say what does not work** TODAY

Every project has a documented limits chapter. Anyone who hears in the first meeting where the technology ends will believe the rest too.

Who for

Not for everyone. Local-first pays off where data sovereignty, offline operation or running costs genuinely hurt.

Mid-sized business

- Field service, trades, logistics, agriculture
- Works where the network does not
- Pays per user today for software that then stalls

Regulated fields

- Health, law, education, public sector
- Must account for where every record ends up
- Wants alternatives to the US cloud, not excuses

Product teams & agencies

- Have the idea, not the P2P experience
- Want a prototype before they rebuild
- Book us as a subcontractor or white label

Business model

Consulting earns money immediately — and is at the same time the sales channel for everything else we build.

- **Fixed-price workshop**

The low barrier to entry. Predictable for the client, qualifying for us: after two days both sides know whether it fits.

- **Project or day rate**

The main revenue. Because we build from our own blocks, the same scope is finished faster than a from-scratch build.

- **Retainer for operations and standby**

Recurring and predictable. Relay and archive operation run through spin-off A and are billed along with it.

- **The real lever: pull, not push**

Every consulting project pulls infrastructure, storage and licences behind it — and produces the reference that sells the next one.

Status & next steps

The substance exists, the offer does not. What is missing is packaging, not capability.

- **References run in public** TODAY

Portfolio, demos, docs and source are reachable — every conversation can be held on a live system instead of slides.

- **An offer sheet with prices** IN PROGRESS

Three packages, three numbers, one page. Without a stated price, an interested party never becomes a meeting.

- **One customer case to show** IN PROGRESS

Yoga Suci as a case study: situation, decision, outcome, limits. One written story sells better than ten repositories.

- **A second head** PLANNED

Consulting scales with people. The first additional developer decides whether this becomes a business or a utilisation trap.

Open questions

The risks of this spin-off are not technical. They are in the calendar.

- **Consulting eats product development**

Every day sold is a day missing from A, B and C. A firm rule is needed — a cap on client days per month — before the first big contract arrives.

- **A category that needs explaining**

Nobody searches for "local-first consulting". They search for "software that works offline" or "GDPR-compliant replacement for vendor X". The pitch has to sound like that.

- **Dependence on very few heads**

The knowledge sits in one or two people today. Without documentation and onboarding, any illness is a project risk.

- **Price against habit**

A project costs a lot once, a SaaS subscription little each month. The five-year comparison belongs on page one of the offer.

LOCAL-FIRST CONSULTING

Let's talk

The first step is a workshop, not a contract. Bring a use case — we will tell you honestly whether local-first is the right route for it.
